

2019 DROUGHTMASTER NATIONAL BULL SALE

Supplementary Information

Understanding Veterinary Bull Breeding Soundness Evaluation (VBBSE) Reports by the Australian Cattle Vets (ACV)

General

A VBBSE generally includes an evaluation of the feet, legs, scrotum and other structural aspects in the Physical section. Crush-side assessment of semen motility is compulsory and laboratory evaluation of Sperm Morphology is optional but results must be declared if tested. If a bull records a "Q" for semen motility (crush-side) it is excluded from the sale unless the bull passes a morphology test.

Scrotum and Physical

ACV standards for Scrotum are the scrotal contents are normal on palpation, and that scrotal size is within normal ranges for the breed, age, and nutrition of the bull.

The standards for Physical require compulsory assessment of eight components. If a bull is noted to fail on any of these, he fails this category.

Report Indicators

Tick = Pass: All attributes for this component measured were consistent with the ACV standards. No risk factors for reduced fertility were identified during this part of the VBBSE examination.

Q = Qualified: Not all attributes for this component were consistent with the ACV standards but these abnormalities may not necessarily preclude the bulls use. A further comment is provided on the individual animal VBBSE certificate.

The standards for Crush-side Semen and Sperm Morphology

Crush-side Semen evaluation and laboratory evaluation of Sperm Morphology are strong indicators of whether a bull is fertile or sub-fertile. If a physically-normal bull is rated as having passed these evaluations, he is expected to be fertile, i.e., if mated, he can impregnate (pregnant at day 42 of gestation) by natural service at least 60% and 90% of 50 normal, cycling, disease-free females within 3 and 9 weeks, respectively.

The ACV has 2 pass levels for crush-side semen evaluation. The highest level - Tick – indicates that the bull is fertile with 60% or higher progressively forward motile sperm. Further, it is very likely that the semen of this bull will be fertile after freezing. The lower level ("Q") was introduced to indicate that a bull may be fertile under natural mating, but it is likely his semen is not suitable for freezing. The Q level is given to bulls with between 30% and 59% motile sperm in a crush-side semen evaluation.

Bulls have to pass thresholds for eight Sperm Morphology categories and achieve 70% or higher normal sperm, as assessed by a sperm morphologist, to gain a Tick for Morphology. A "Q" for Morphology means the bull doesn't meet all the criteria for a Tick and that some risks have been identified which may impact the bull's fertility in the short or long term. The veterinarian conducting the test will provide an explanation of these risks in the comments section.

It is possible that physically normal, Q-level bulls (and especially those close to the lower threshold) may be shown to be less than fully fertile when mated. Such bulls are acceptable under multiple-sire mating, but veterinary advice should be considered before single-sire mating of such bulls.

Bulls in the Droughtmaster catalogue with semen motility in the Q category are required to have passed a semen morphology test prior to acceptance in the sale.

Changes in semen quality in sexually-mature bulls

Once bulls are sexually mature and producing satisfactory quality ejaculates, testes function is relatively stable, ie, if the bull is tested 3 months prior to sale and passes a semen evaluation, then, if managed under the same conditions without experiencing conditions that cause problems with function of the testes, there is a high probability (based on research done in northern Australia) that if tested again on the day of sale it would produce an ejaculate containing a similar proportion of normal sperm. If a bull experiences trauma, fever, inflammation, fat insulation or stress, that are sufficient to impair sperm formation and maturation, semen quality may be affected within days and may persist for several months.

It takes about 60 days for a sperm cell to develop and then a further 10 days for it to mature and be available for ejaculation. Therefore, a sperm quality assessment reflects function of the testes in the preceding 70 – 80 days. Conversely, if a bull experiences problems such as trauma, fever, inflammation, fat insulation or stress, which are sufficient to impair sperm formation, he may produce effective ejaculates for at least 2 months.

If a bull has passed a semen evaluation, and does suffer an event that causes temporary sub-fertility, it is most likely that fertility will be restored once the bull is returned to sound stable management.

Dentition

The dentition reported in the Supplementary Sheet is relevant to the date of the veterinary inspection which may be performed up to 42 days prior to the sale.

There is evidence that the time taken from emergence to fully erupted of a pair of permanent teeth can be as little as 2 weeks, therefore an additional set may have appeared within the allowable inspection window.

ACV Soundness Evaluation – Explanation Codes

Tick in Physical = Pass

Q in Physical = Pass with Qualifications

Tick in Semen = 60% (or greater) Progressively Motile Sperm

NT = Not Tested

Q in Semen = 30 to 59% motile – requires a mandatory morphology test result of >50% Normal Sperm.
